Amazon Fine Food Reviews Analysis

Data Source: https://www.kaggle.com/snap/amazon-fine-food-reviews

EDA: https://nycdatascience.com/blog/student-works/amazon-fine-foods-visualization/

The Amazon Fine Food Reviews dataset consists of reviews of fine foods from Amazon.

Number of reviews: 568,454
Number of users: 256,059
Number of products: 74,258
Timespan: Oct 1999 - Oct 2012
Number of Attributes/Columns in data: 10

Attribute Information:

1. Id
2. ProductId - unique identifier for the product
3. UserId - unqiue identifier for the user
4. ProfileName
5. HelpfulnessNumerator - number of users who found the review helpful
6. HelpfulnessDenominator - number of users who indicated whether they found the review helpful or not
7. Score - rating between 1 and 5
8. Time - timestamp for the review
9. Summary - brief summary of the review
10. Text - text of the review

Objective:

Given a review, determine whether the review is positive (rating of 4 or 5) or negative (rating of 1 or 2).

Create PDF in your applications with the Pdfcrowd HTML to PDF API PDFCROWD

[Q] How to determine if a review is positive or negative?

[Ans] We could use Score/Rating. A rating of 4 or 5 can be cosnidered as a positive review. A rating of 1 or 2 can be considered as negative one. A review of rating 3 is considered nuetral and such reviews are ignored from our analysis. This is an approximate and proxy way of determining the polarity (positivity/negativity) of a review.

[1]. Reading Data

[1.1] Loading the data

The dataset is available in two forms

1. .csv file
2. SQLite Database

In order to load the data, We have used the SQLITE dataset as it is easier to query the data and visualise the data efficiently.

Here as we only want to get the global sentiment of the recommendations (positive or negative), we will purposefully ignore all Scores equal to 3. If the score is above 3, then the recommendation wil be set to "positive". Otherwise, it will be set to "negative".

[2] Exploratory Data Analysis

[2.1] Data Cleaning: Deduplication

It is observed (as shown in the table below) that the reviews data had many duplicate entries. Hence it was necessary to remove duplicates in order to get unbiased results for the analysis of the data. Following is an example:

In [9]:
```
display= pd.read_sql_query("""
SELECT *
```

Create PDF in your applications with the Pdfcrowd HTML to PDF API PDFCROWD

```
FROM Reviews
WHERE Score != 3 AND UserId="AR5J8UI46CURR"
ORDER BY ProductID
""", con)
display.head()
```

	Id	ProductId	UserId	ProfileName	HelpfulnessNumerator	HelpfulnessDenominator	Score	Time	Sum
0	78445	B000HDL1RQ	AR5J8UI46CURR	Geetha Krishnan	2	2	5	1199577600	LOACK QUADR VANILL WAFER
1	138317	B000HDOPYC	AR5J8UI46CURR	Geetha Krishnan	2	2	5	1199577600	LOACK QUADR VANILL WAFER
2	138277	B000HDOPYM	AR5J8UI46CURR	Geetha Krishnan	2	2	5	1199577600	LOACK QUADR VANILL WAFER
3	73791	B000HDOPZG	AR5J8UI46CURR	Geetha Krishnan	2	2	5	1199577600	LOACK QUADR VANILL WAFER
4	155049	B000PAQ75C	AR5J8UI46CURR	Geetha Krishnan	2	2	5	1199577600	LOACK QUADR VANILL WAFER

As it can be seen above that same user has multiple reviews with same values for HelpfulnessNumerator, HelpfulnessDenominator, Score, Time, Summary and Text and on doing analysis it was found that

Create PDF in your applications with the Pdfcrowd HTML to PDF API PDFCROWD

ProductId=B000HDOPZG was Loacker Quadratini Vanilla Wafer Cookies, 8.82-Ounce Packages (Pack of 8)

ProductId=B000HDL1RQ was Loacker Quadratini Lemon Wafer Cookies, 8.82-Ounce Packages (Pack of 8) and so on

It was inferred after analysis that reviews with same parameters other than ProductId belonged to the same product just having different flavour or quantity. Hence in order to reduce redundancy it was decided to eliminate the rows having same parameters.

The method used for the same was that we first sort the data according to ProductId and then just keep the first similar product review and delelte the others. for eg. in the above just the review for ProductId=B000HDL1RQ remains. This method ensures that there is only one representative for each product and deduplication without sorting would lead to possibility of different representatives still existing for the same product.

In [10]:
```
#Sorting data according to ProductId in ascending order
sorted_data=filtered_data.sort_values('ProductId', axis=0, ascending=True, inplace=False
, kind='quicksort', na_position='last')
```

In [11]:
```
#Deduplication of entries
final=sorted_data.drop_duplicates(subset={"UserId","ProfileName","Time","Text"}, keep='f
irst', inplace=False)
final.shape
```

```
(99724, 10)
```

In [12]:
```
#Checking to see how much % of data still remains
(final['Id'].size*1.0)/(filtered_data['Id'].size*1.0)*100
```

```
86.71652173913044
```

Observation:- It was also seen that in two rows given below the value of HelpfulnessNumerator is greater than HelpfulnessDenominator which is not practically possible hence these two rows too are removed from

Create PDF in your applications with the Pdfcrowd HTML to PDF API PDFCROWD

calcualtions

In [13]:
```
display= pd.read_sql_query("""
SELECT *
FROM Reviews
WHERE Score != 3 AND Id=44737 OR Id=64422
ORDER BY ProductID
""", con)

display.head()
```

	Id	ProductId	UserId	ProfileName	HelpfulnessNumerator	HelpfulnessDenominator	Score	Time	Summ
0	64422	B000MIDROQ	A161DK06JJMCYF	J. E. Stephens "Jeanne"	3	1	5	1224892800	Bought This for Son at College

```
(99722, 10)

1    83711
0    16011
Name: Score, dtype: int64
```

[3] Preprocessing

[3.1]. Preprocessing Review Text

Now that we have finished deduplication our data requires some preprocessing before we go on further with analysis and making the prediction model.

Hence in the Preprocessing phase we do the following in the order below:-

1. Begin by removing the html tags
2. Remove any punctuations or limited set of special characters like , or . or # etc.
3. Check if the word is made up of english letters and is not alpha-numeric
4. Check to see if the length of the word is greater than 2 (as it was researched that there is no adjective in 2-letters)
5. Convert the word to lowercase
6. Remove Stopwords
7. Finally Snowball Stemming the word (it was obsereved to be better than Porter Stemming)

After which we collect the words used to describe positive and negative reviews

In [16]:
```
# printing some random reviews
sent_0 = final['Text'].values[0]
print(sent_0)
print("="*50)
```

Create PDF in your applications with the Pdfcrowd HTML to PDF API PDFCROWD

```
sent_1000 = final['Text'].values[1000]
print(sent_1000)
print("="*50)

sent_1500 = final['Text'].values[1500]
print(sent_1500)
print("="*50)

sent_4900 = final['Text'].values[4900]
print(sent_4900)
print("="*50)
```

```
My dogs loves this chicken but its a product from China, so we wont be buying it anymore.  Its very hard to find any chicken
products made in the USA but they are out there, but this one isnt.  Its too bad too because its a good product but I wont t
ake any chances till they know what is going on with the china imports.

r will be able to use it w/her family.<br />If you  are a BEST FOODS lover---walk away---do NOT purchase this product!
==================================================
These people from Bavaria really know how to make this stuff. The Landjagers are super (you have to let them dry for them to
develop their full, intended flavor), and it is worth any sausage fan's time to check out their complete offering of German
style sausages and hams.  Due to the perishability of some of their products their S&H charges appear outrageous but I guess
that sending frozen or refrigerated foods costs money.  Personally, I recommend their coarse grind liverwurst but that is a
matter of personal taste.

[5] Assignment 8: Decision Trees

1. **Apply Decision Trees on these feature sets**
    - SET 1:Review text, preprocessed one converted into vectors using (BOW)
    - SET 2:Review text, preprocessed one converted into vectors using (TFIDF)
    - SET 3:Review text, preprocessed one converted into vectors using (AVG W2v)
    - SET 4:Review text, preprocessed one converted into vectors using (TFIDF W2v)

2. **The hyper paramter tuning (best `depth` in range [1, 5, 10, 50, 100, 500, 100], and the best `min_samples_split` in range [5, 10, 100, 500])**
    - Find the best hyper parameter which will give the maximum AUC value
    - Find the best hyper paramter using k-fold cross validation or simple cross validation data
    - Use gridsearch cv or randomsearch cv or you can also write your own for loops to do this task of hyperparameter tuning

Create PDF in your applications with the Pdfcrowd HTML to PDF API PDFCROWD

3. **Graphviz**
    - Visualize your decision tree with Graphviz. It helps you to understand how a decision is being made, given a new vector.
    - Since feature names are not obtained from word2vec related models, visualize only BOW & TFIDF decision trees using Graphviz
    - Make sure to print the words in each node of the decision tree instead of printing its index.
    - Just for visualization purpose, limit max_depth to 2 or 3 and either embed the generated images of graphviz in your notebook, or directly upload them as .png files.

4. **Feature importance**
    - Find the top 20 important features from both feature sets Set 1 and Set 2 using `feature_importances_` method of Decision Tree Classifier and print their corresponding feature names

5. **Feature engineering**
    - To increase the performance of your model, you can also experiment with with feature engineering like :
        - Taking length of reviews as another feature.
        - Considering some features from review summary as well.

6. **Representation of results**
    - You need to plot the performance of model both on train data and cross validation data for each hyper parameter, like shown in the figure.
     Once after you found the best hyper parameter, you need to train your model with it, and find the AUC on test data and plot the ROC curve on both train and test.
     Along with plotting ROC curve, you need to print the confusion matrix with predicted and original labels of test data points. Please visualize your confusion

Create PDF in your applications with the Pdfcrowd HTML to PDF API PDFCROWD

matrices using seaborn heatmaps.

7. **Conclusion**
    - You need to summarize the results at the end of the notebook, summarize it in the table format. To print out a table please refer to this prettytable library link

Note: Data Leakage

1. There will be an issue of data-leakage if you vectorize the entire data and then split it into train/cv/test.
2. To avoid the issue of data-leakag, make sure to split your data first and then vectorize it.
3. While vectorizing your data, apply the method fit_transform() on you train data, and apply the method transform() on cv/test data.
4. For more details please go through this link.

Applying Decision Trees

[5.1] Applying Decision Trees on BOW, SET 1

In [39]:

```
# Please write all the code with proper documentation
depth  =[5,10,50,100,500,1000]
split = [5,10,50,100,500,1000]
BOW_Train_score = []
BOW_val_score = []
for i in depth:
    bow_tr = []
    bow_val = []
    for j in split:
```

Create PDF in your applications with the Pdfcrowd HTML to PDF API PDFCROWD

```
        model= DecisionTreeClassifier(max_depth=i,min_samples_split=j)
        model.fit(BOW_Train,y_tr)
        train_data = model.predict_log_proba(BOW_Train)[:,1]
        val_data = model.predict_log_proba(BOW_CV)[:,1]
        train_data[np.isinf(train_data)]=0
        train_data[np.isnan(train_data)]=0
        val_data[np.isinf(val_data)]=0
        val_data[np.isnan(val_data)]=0

        bow_tr.append(roc_auc_score(np.asarray(y_tr),np.asarray(train_data)))
        bow_val.append(roc_auc_score(np.asarray(y_cv),np.asarray(val_data)))
    print(str(bow_tr)+"    "+str(bow_val))
    BOW_Train_score.append(bow_tr)
    BOW_val_score.append(bow_val)

[6] Conclusions

In [74]:
```
# Please compare all your models using Prettytable libraryfrom prettytable import Pretty
Table
from prettytable import PrettyTable
x = PrettyTable()
x.field_names = ["Model","value of depth","value of split","Train AUC","Test AUC"]
x.add_row(["BOW",50,500,0.84,0.82])
x.add_row(["TFIDF",50,500,0.84,0.81])
x.add_row(["Avg_w2v",5,500,0.85,0.83])
x.add_row(["TFIDF_w2v",10,500,0.84,0.80])

print(x)
```

```
+-----------+---------------+---------------+-----------+----------+
|   Model   | value of depth | value of split | Train AUC | Test AUC |
+-----------+---------------+---------------+-----------+----------+
|    BOW    |       50       |      500       |    0.84   |   0.82   |
|   TFIDF   |       50       |      500       |    0.84   |   0.81   |
|  Avg_w2v  |       5        |      500       |    0.85   |   0.83   |
| TFIDF_w2v |       10       |      500       |    0.84   |   0.8    |
+-----------+---------------+---------------+-----------+----------+
```

Here we can see that our Avg_W2V model got the highest AUC value and is the best moddel with min_spli = 500 and depth = 5
